9/7/26

```
#include <stdio.h>
struct Student
  {
    int rollno;
    char grade;
    float marks;
  };
int main()
  {
    struct Student s;
    Printf("Size of Structure = %zu bytes \n", sizeof(s));
    return 0;
  }
```

Manual

int - 4
char - 1 } total = 9 bytes
float - 4

Program o/p:- Size of structure = 12 bytes

No, they are different. Because of structure padding (alignment). The compiler inserts extra unused bytes b/w members or at the end of the structure, so that data is aligned in memory for faster access by the CPU.
