(1) Open Amazon website and find out 10 different functions

(2) return 1 or return 0 means what and main returns to who?

(1A) Search bar - find products by keyword, category or brand

Cart - add items and review before checkout

Wishlist - save items for later without buying

Order tracking - see shipment status and delivery estimates

Customer reviews & ratings - read/write product feedback

Recommendations (customers also bought) - personalized suggestions

Prime membership - free/fast shipping, video, music perks

Returns & refunds center - manage returns from your orders

Payment methods - manage cards, gift cards, Amazon pay

Account settings - addresses, order history, subscriptions (Subscribe & Save)

(2A) return 0 - Signals the program finished successfully, with no errors.

return 1 - Signals the program finished with an error/failure. Different nonzero codes can represent different error types.

main returns to who? - the operating system (technically the shell/process that launched the program). That exit code is how the OS or calling script knows whether your program succeeded or failed.

Eg - in a shell script you can check it with $? (Linux/Mac) or %errorlevel% (Windows).
